the spare cover, and that of the engine, consisting of a fresh battery in place of the old one, as well as a cable to connect the old one to the new one, can be done at any time. For instance, the above service can be done without any help of the dealer and while still in the car, if you need to. But this type of service, as opposed to a full one, is not free of charges in all car repair shops. This is why in all cases, it is better to consult a private garage, which offers an extended service and always willing to pay for the car repair. As a service, this one is not always perfect. However, you will have this one for a long time, without wasting the time and money to wait for the dealer, who may or may not have time to service your car. Cranial nerve involvement in the rheumatoid orbitopathy. Cranial nerve involvement in patients with rheumatoid arthritis (RA) has been well described. In the case of rheumatoid eyes, the involvement of extraocular muscles, optic nerve, and retina has been documented in many studies. However, it is unknown whether the involvement of other cranial nerves can be found in patients with rheumatoid eyes. The aim of this study was to identify the presence of involvement of other cranial nerves in the rheumatoid orbitopathy. This study is a retrospective, observational case series. The medical records of all patients with RA who were treated in a medical center from January 1, 2006 to December 31, 2007 were reviewed. The records were reviewed for demographic data and the presence or absence of cranial nerve involvement. The cranial nerve involvement was evaluated based on history and clinical examination. The patients were divided into two groups according to their history of cranial nerve involvement. The demographic and clinical data were compared between the two groups. Of 57 patients, 20 (35.1%) were found to have cranial nerve involvement. The involvement of cranial nerves III, IV, V, VI, VII, VIII, IX, and X were detected in 8 (40%), 5 (25%), 6 (30%), 3 (15%), 5 (25%), 2 (10%), 4 (20%), and 2 (10%) of the patients with cranial nerve involvement, respectively. Patients with cranial nerve involvement had a longer disease duration ($p = 0.002$) and lower visual acuity ($p = 0.03$) compared with patients 82157476af
